## woodgrain like aluminium profile

woodgrain like aluminium extrusion Simulation of wood, extruded aluminum first spraying primer, and then the grain on the surface of pasted paper, through vacuum heating process, the penetration to wood completely uniform to the spraying primer.

The surface of the aluminum material is fine and smooth, with high coating hardness and strong adhesion.

Acid resistance, weather resistance, boiling resistance, alkali resistance and impact resistance are strong. The surface of aluminum is treated with simulated wood pattern, and it can achieve or even exceed the decorative effect of solid wood.
